

Sample Paragraph  
For science Notebook  
(L.A.B.2.2.1.4.1)

Have you wondered how things got into and out of our body cells? The coffee filter experiment we did today made that very easy to understand. The membrane holds all the parts of the cell inside, but it lets the food, oxygen, and water pass through the membrane into the cell. Then the urea and carbon dioxide pass through the cell membrane going out of the cell. The membrane must be closed enough to keep cell parts like cytoplasm, organelles, and the nucleus inside and still be open enough to let things needed for keeping the cell alive pass in and out. Isn't the cell membrane an interesting part of our body!
